

## Module -3

### 1-Different type of cloud storage

Ans – There are three types of cloud storage

1. Public
2. Private
3. Hybrid
  1. Public cloud storage - Services delivered over the internet and shared across many customers.
  2. Private cloud storage - Private Cloud is a cloud service that is used by only one organization.
  3. Hybrid cloud storage - A mix of both public and private clouds, allowing data to move between them.

### 2-What is role base access control and identity and access management and MFA

Ans – 1. Identity & Access Management - that ensures the right people have access to the right account. Access management is granting permission to user for see a specific folder or use a specific policy.

2. MFA - MFA is a security layer that requires you to provide proof to verify your identity. It's very useful for security.

### 3-What is physical and virtual host allocation?

Ans – 1. Physical host allocation - This is also known as Dedicated Hosting. The cloud provider gives you the entire physical server. No other customers are allowed to put their data on that specific machine.

2. Virtual Host Allocation - In simple words, Virtual Host Allocation is when a single physical computer is shared among many virtual computers. Instead of one person using the entire server the server is carved up so that multiple people or applications can use it at the same time, without interfering with each other.

### 4-How to access resource of cloud computing?

Ans -1. The Web Console - This is the Graphical User Interface. You log in through a web browser using a username and password.

Examples: AWS Management Console, Azure

2. Command Line Interface - The CLI allows you to type text commands into a terminal (like PowerShell on Windows or terminal) to control your cloud.

3. Mobile Apps - AWS, Azure, Google have mobile apps to provide to access resource of cloud computing.

5 -What is disaster recovery?

Ans - In simple words, Disaster Recovery (DR) in the cloud is using a cloud provider's infrastructure to store a "spare copy" of your entire business system so you can switch to it if your main office or data centre fails.
